# The Cyber Man

In this new brave world of AI, merge with the machine or be left behind.

## Vision

So my simple vision is we got the cyber truck, the cyber centaur, cyber space, bitcoin which is cyber capital... It's funny because the word cyber is kind of an old outdated word, you think about cybernetics, RoboCop, etc.

Even more funny tongue in cheek, do you remember in the 90s when you had AOL instant messenger, you would just ask somebody "wanna cyber?"

## Make it all cyber

So at this point, AI is like the ultimate hallucination machine. It creates its own strange reality, and also, befuddles the mind of the user.

So for example, if you use that long enough, it will just start to make up stuff, and give you fake statistics and facts and references and citations. This is a big problem because even if you are a non-malicious human, using it... Sooner or later you're going to fool yourself.

The critical issue is that I think with AI... Even more than Google, it is like the ultimate authority. This becomes a bit concerning because **when our children become older... Certainly more people are going to use AI rather than less**.

At this point, Google search is starting to feel like AOL 3.0. And ChatGPT is like fiber optics on steroids.

Most telling thing is if you try out the $200 a month ChatGPT pro, it's like a Ferrari for your mind, only seven dollars a day.

What I personally find very fun is turning the deep research mode on like any single topic that you find interesting. you want to melt the silicon.

Also... Using the new o3 mode,,, it's like smarter and funnier than myself.

## How

So my personal thought is AI is like the ultimate lever. Think of it like a lever for your mind.

For example, you need to move 1000 pound stone, easier to attach it to a hip thrust machine, and lift the weight that way... Just search my 508 kg kilogram rack pull... rather than trying to lift it straight off the floor, like a fool.

## Leverage

Leverage is the key. Almost everything is a lever. Even a bicycle, the ultimate lever for the human body.

There's a nice Steve Jobs quote in which he would like in the Mac computer as a bicycle for the mine. Why? Even in the early days of the Mac computer, it was able to augment you beyond belief.

Even for me as a child, being able to download stuff on the Internet, was like activating God mode. Why? Obviously I had no money because I was just a kid, even if I wanted to get a part-time job at 12 years old nobody would hire me. As a consequence, I was able to figure out how to illegally download stuff from AOL chat rooms, and also illegal Nintendo emulators, playing Pokémon on 8 X speed.

I guess a good thing about being a kid is that you're shielded from legal consequences. Ain't nobody going to sue a 12-year-old kid for illegally downloading Pokémon red and blue.

Other adults we don't need to pirate anymore because we have money. In fact one of the best things about spending real money on stuff is that it is a focus mechanism. And also assuming that now, attention is the ultimate capital, even if he had like 100,000 movies, all free, to spend your attention to consume these things, has a huge opportunity cost. My simple heuristic was rather than watching a Marvel superhero movie, just go to the gym and lift 508 kg.

## what else

If I could tell you that I could magically give you $1 million Ferrari, for your mind, that would help you sleep 8 to 12 hours a night, replace all of your tedious work, make you 1 trillion times more creative and happy, how much are you willing to pay for this? $20 a month, $200 a month, $2000 a month?

## Why this is the path forward

Jony Ive has effectively joined open ai, and they are already working on the device. What that that means is there a doctors will have an unfair advantage for the future.

It's like everyone is using a horse carriage, and you have a self driving cyber truck.

## Future

I think the simple trajectory is that the obvious obvious obvious thing is that there is gonna be two things which is it. Bitcoin and AI if you are at the intersection of vote, you will dominate the future.

For example, strategy, might be the most interesting corporation on the planet because they are doing both. There are the forerunners of business intelligence like since the 90s... And now Michael Saylor is going full force.

Why the future?

Why not?

Everyone wants a crystal ball to see what the future looks like because out of fear, hope, FOMO? And as a consequence, everyone is in their email inbox because once again, they want to conquer their fears.

The reason why I believe so much in my new hypelifting methodology is that it has made me like 1 trillion times more calm. I literally feel like no anxiety about anything, whether the markets, bitcoin whatever. And now that I have ChatGPT pro, I feel like my mind is on steroids.

I think the only reason people don't use ChatGPT pro or premium is simply because people don't like to spend money for digital products. Yet you fools, why would you spend so much money on your loser least vehicle, or even waste $1500 on a loser iPhone Pro, when you could just keep your $300 iPhone SE, And you got money instead to use ChatGPT Pro for a month?

Long story short, Grok sucks, ChatGPT is the only one that is good. And note, the o3 model is like 1000x better than even 4o.

Deep research mode, is really the game killer here. If you could have like 1000 Einstein's working for you, 24 seven 365, that doesn't have to eat sleep, or even use the toilet... And I can give you 100 Elon Musk Who is 100% obedient... Isn't this the way?

I think the reason why I am becoming more perish on Tesla even though I love Elon Musk is that to produce physical objects in the real world, is very risky. **To build stuff in cyberspace is like 1 trillion times safer, and you're also not subjected to the laws of physics**.

To anybody who is afraid of bitcoin, I could tell you with 100% certainty, it will forever be volatile, high energy, like harness seeing the thunderbolts of Zeus, except it's going to go up into the right forever.

MSTR is the same. It's like pouring bacon grease on a steak.

MSTU even more interesting, it's like throwing napalm fatty pork cheek.

## I don’t know a single human being that does not want to be wealthy

Even if you are a Buddhist monk or a nonprofit... 99% of their existence is economic. Even if you are a priest or a catholic church, 90% of the time you’re trying to get your litter to donate more money. Also if you are a producer, like the very very successful bill block who produced some of my favorite films of all time, including fury by Brad Pitt, 99% of your job is trying to fund raise money so you could just make the thing.

**Money is not the source of all evil, fiat currency is**.
